

Adrij Shikhar

Senior Software Engineer / Systems, Connector Platforms & Agent Tooling

adrijshikhar26@gmail.com • +918218058928 • Bengaluru, India
adrijshikhar.dev • github.com/adrijshikhar • linkedin.com/in/adrij-shikhar

TECHNICAL SKILLS

- Languages & Systems:** Go, Java 17, TypeScript / JavaScript, Python, Rust (tooling/patches), SQL, C/C++
- Data & Streaming:** Kafka, Debezium (CDC), Temporal, Apache Spark, Postgres, MySQL, Snowflake, BigQuery, Redshift, Redis, SQLite
- Cloud & Infrastructure:** Docker, Kubernetes, AWS (Fargate, S3, Comprehend), Google Cloud Platform, Terraform, GitHub Actions, CircleCI, Linux
- AI & Agent Tooling:** Model Context Protocol (MCP), Agent Skills & Harnesses, LLM APIs, CLI / TUI Ergonomics, Claude Code, Antigravity CLI, Codex CLI
- Observability & Testing:** OpenTelemetry, Grafana, Testcontainers, JUnit, RE2J, k6, Continuous Release Gates

WORK EXPERIENCE

Hevo Data • Senior Software Engineer Bengaluru / Jun 2022 – Present

Agent-Native Tooling

- Built the surface that lets LLMs generate and operate connectors: construct library, connector generator, installable CLI, skill library, and an MCP server exposing platform APIs to agents.
- Started the internal agent-tooling platform the team now builds on — repo structure, skill conventions, CI auto-release, and marketplace distribution.

Connector Platform & Architecture

- Made connector authentication declarative: transformed auth from bespoke platform processors, DB migrations, and cross-service coordination into zero-code configuration files.
- Moved runtime configuration and config templates into connectors behind a compatibility kit that gates correctness at build time rather than in review.
- Standardised connector repo creation, versioning, and release behind a central BOM, decoupling the fleet from the shared platform SDK runtime.

Connection Reliability & Validation

- Owned the test-connection contract end-to-end; dropped false-negative rate from >30% to nil in validation — ensuring failing checks indicate true connection faults.
- Delivered pre-flight configuration validation across all sources/destinations (Postgres, MySQL, Oracle, SQL Server, Snowflake, BigQuery, Redshift) with p95 latency < 10s.

Failure Visibility & Performance

- Engineered dynamic error classification, cutting classification cycle time from 3–7 days (full release) down to minutes.
- Root-caused production pipeline hangs to the regex engine; migrated to RE2J to bound worst-case evaluation under 5s, reducing load test stalls from several minutes to 1m19s.
- Instrumented connection health metrics and HTTP client telemetry in construct libraries to detect API rate-limiting before sync failure.

Data Correctness & Scale

- Delivered SCD Type 2 history mode across Snowflake, BigQuery, and Redshift (including Redshift's non-MERGE four-statement path).
- Implemented real-time CDC on Debezium and built the schema catalog service from scratch — schema versioning, metadata management, and compatibility checks across evolution.
- Scaled object handling from 1,000 to 25,000 objects with a 5x gain in MySQL ingestion throughput, and engineered parent-child handling with inferred deletes.

Engineering Velocity

- Cut build/CI runtimes against 90-day baselines: mvn clean verify from 31:43 to 10:33, CI from 43:32 to 21:24 on initial service, and 11:07 to 5:15 across the fleet.
- Built the unified developer CLI and local platform so teams execute full pipeline stacks locally rather than contending for shared cloud environments.

EARLIER ENGINEERING EXPERIENCE

Hevo Data • Software Development Intern	Sep 2021 – Oct 2021
Integrated 'wal2json' replication plugin for Postgres; cut WAL processing latency by 60% with dynamic Guice injection.	
Rephrase.ai • Software Development Intern	Oct 2020 – Mar 2021
Built backend services for GenAI synthetic video generation using GraphQL, Python/Django, ffmpeg, and Stripe.	
Powerplay • Software Engineering Intern	Apr 2020 – Jun 2020
Developed RESTful APIs, JWT auth, and customizable UI component systems for real-time construction site tracking.	
MTX Global • Software Development Intern	Jun 2021 – Aug 2021
Created streaming ETL pipeline PoCs using Apache Spark, Kafka, and Google Kubernetes Engine (GKE).	

SELECTED SYSTEMS PROJECTS

Binsight • Author / Maintainer
[binsight.adrijshikhar.dev](#) • [github.com/adrijshikhar/binsight](#)
TECHNOLOGIES: Go SQLite React Astro Tailwind CSS MySQL Docker Homebrew

- Engineered a local, read-only MySQL/MariaDB binlog viewer, decoder, and transaction analyzer.
- Indexes decoded binlogs in SQLite with a virtualized event stream, transaction grouping, row-image inspection, and anomaly detection across 6 position traps.

2026 – Present

aim • Author / Maintainer
[github.com/adrijshikhar/aim](#)
TECHNOLOGIES: Go Bubble Tea TUI CLI OAuth PKCE

- Built an interactive TUI/CLI for running AI coding assistants (Claude Code, Codex, Antigravity) in isolated profiles with separate configs, token states, and histories.
- Features browser OAuth PKCE authentication, session browsing, and real-time quota telemetry.

2026 – Present

cxstatusline • Author / Maintainer
[cxstatusline.adrijshikhar.dev](#) • [github.com/adrijshikhar/cxstatusline](#)
TECHNOLOGIES: TypeScript Bun Rust Ink

- Developed a 1–3 row terminal statusline for OpenAI Codex CLI with an interactive terminal config UI and browser playground.
- Instruments session context, Git state, token usage, and reset timers via a versioned Rust patch.

2026 – Present

catalyst • Author / Maintainer
[github.com/adrijshikhar/catalyst](#)
TECHNOLOGIES: Agent Skills Python Shell JSON Schema

- Designed a cross-agent coding session handoff harness storing typed, schema-validated briefs in repository state for seamless task resumption.

2026 – Present

EDUCATION

Indian Institute of Technology, Roorkee • **Bachelor of Technology (B.Tech)**
Graduated with strong foundations in computer science, distributed algorithms, data structures, and systems engineering.

July 2018 – May 2022
